SHUBHAM JOSHI

Applied AI Engineer | San Francisco, CA | (202) 440-8445 | shubhamjoshipro.mail@gmail.com
Watch the Demo | Portfolio | Research Report | Hugging Face | github.com/shubhamjoshipromail-svg | linkedin.com/in/shubham-joshi1

SUMMARY

AI engineer who builds intelligent applications on foundation models, ships them to real users, then makes them reliable enough to keep running. In the last year: 508 commits and 92,448 lines across 11 public repositories, 8 deployed and live right now, a fine tuned model on Hugging Face, and 40 written product specifications totaling 6,700 lines. The two I would show first: a governed agent platform taking real actions across Gmail, Calendar, Docs and Search, and a generative product shipping at once as a web app, a Chrome extension and a signed macOS desktop build. I build the whole thing, then I try to break it, and I report what broke.

SKILLS

Generative AI and Agents: Large Language Models and foundation models (Anthropic Claude, OpenAI GPT and Codex, Gemini); agent orchestration, multi agent workflows, tool and function calling, Model Context Protocol, retrieval design, prompt engineering, structured output, multi provider routing and cost optimization, AI assisted development with Cursor, Claude Code and Codex

Evaluation, Governance and Security: LLM evaluation and eval harnesses, scenario and regression testing, red teaming and prompt injection defense, deny by default guardrails, responsible AI and agent governance, human in the loop approvals, secure credentials, audit trails, confidence gating and abstention, drift monitoring, fairness auditing, SHAP and LIME

Engineering, Deployment and Delivery: Technical discovery with non technical stakeholders, requirements scoping, written specifications, live demos, workshop delivery, executive and client readouts. Python, TypeScript, JavaScript, SQL; FastAPI, Next.js, React, Node, PostgreSQL, Prisma, REST APIs, streaming over SSE, durable job queues, idempotency, crash recovery, observability and product metrics, latency and cost profiling, Docker, Git, CI/CD, Railway and Hugging Face deployment; PyTorch and transformer fine tuning; Tauri desktop and Chrome extension packaging

PROJECTS

AgentDock, Agent Platform with Governed Tool Execution Live app | Watch demo | Code

- Built a platform turning a plain language goal into a running multi step agent automation across Gmail, Calendar, Docs and Search, so scattered manual work becomes something a non technical user can trigger, watch and approve. Solo build: product, schema, backend, frontend, tests. Rather than hardcode a tool list it syncs and classifies the official Model Context Protocol registry by category, risk and verification, so the catalog grows with the ecosystem, not my releases.
- Solved what actually blocks agent adoption, which is trust rather than capability: deny by default permissions clamped server side so prompt text can request capability but never grant it, approval gates before any outbound action, encrypted credentials and budget caps. Then proved it instead of asserting it, with a red team suite showing prompt injection arriving through tool output cannot fire an unapproved send, plus named tests for crash recovery, approval idempotency and honest failure when credentials break.
- Specified it before building it, in 24 written design documents covering the orchestrator, the tool integration model, and an interaction spec for how an agent pauses mid run to ask a person, then resumes. Sustained 225 commits and 35,539 lines in two months with 11,000 lines of tests across 60 test files: a PostgreSQL job queue with lease and heartbeat crash recovery, idempotent external actions, concurrency caps, live run streaming over SSE, and per run cost tracking across 33 API routes.

Vibe Curator, Generative AI Product Shipped in Three Form Factors Live app | Code and releases

- Shipped a real time creative tool across 104 commits and 19,913 lines where four providers land in one editable scene model, so a generation is starting material rather than a flattened file: OpenAI for images, Anthropic for shader effects, Gemini Veo for video, ElevenLabs for music. It runs three ways at once: a live web app, a Chrome extension with Web Store release assets, and a signed Tauri desktop build for macOS on versioned GitHub prereleases.
- Made unreliable generation dependable by treating the model as an untrusted code author, the general lesson for shipping any codegen feature: model written GLSL clears a static guard and a real compile pass before it renders, and line numbered errors feed back so retries converge within 3 attempts. Took it to an invited beta on a runbook naming the release boundary and what is out of scope, with credits reserved server side so a generation cannot start without budget.

OpsPilot, RxCheck, Nimbus and FridgeChef, Deployed AI Products Live model | RxCheck | Nimbus | FridgeChef | Report

- OpsPilot: diagnosed instead of scaling. Baselines put TF-IDF at 44 and a fine tuned ModernBERT at 52.3 percent, so the labels were the problem; rebuilding an overlapping 10 label taxonomy into 7 operational queues lifted accuracy to 73.1 percent. Shipped with abstention rather than forcing every prediction: confidence gating auto routes 62.3 percent of tickets at 85.5 percent accuracy and escalates the rest. The model is public.
- RxCheck reviews 152,416 records on a hard boundary, the database decides and the model only explains, proven by a 26 of 26 scenario evaluation that passes even when every external service fails. Its research report is where I published the findings that made me look bad: my own validator accepted 15 malformed outputs it should have rejected, and an official benchmark passed only 22 of 30. Nimbus is an AI companion for student burnout answering with one useful next step instead of a dashboard; FridgeChef turns a fridge photo into a recipe streamed live.

EXPERIENCE

Founder, Digital Marketing and Web Studio, self-employed - Nagoya, Japan Jan 2021 - May 2025

- Ran a studio single handed for four years and carried the whole commercial loop: found the clients, scoped and priced the work, delivered websites, content and campaigns for international customers in a third language, and answered for the result when a campaign underperformed. Being the person the customer calls is where I learned discovery, and how to say no to the wrong scope.

Co-Founder and Vice President, Business Analytics and AI Organization, Johns Hopkins University - Washington, DC Jan 2026 - Present

- Co-founded and lead a 100 member student organization alongside my degree, a part time role built on enablement, the same skill as driving adoption: designed and delivered a 3 hour hands on workshop on agents and modern AI development to 35 registrants, published the guide open source, and write a recurring analysis series.

Analytics Consultant, Johns Hopkins University, Client: Alliance of Community Health Plans - Washington, DC Jul 2025 - Jul 2026

- Led technical execution for a six person team on a national client engagement, building the pipeline that reconciled four inconsistent federal sources into a 138,263 row dataset and catching a twelvefold error before it reached a model, then delivered it as Tableau dashboards and an in person readout leadership could act on, which shaped the client's strategy. Team placed top 3 school wide.

EDUCATION

Johns Hopkins University, Carey Business School - MS, Business Analytics and Artificial Intelligence, STEM designated, Dean's Scholarship Aug 2026

Nagoya University of Commerce and Business - BBA in Management, **GPA 3.63** (WES evaluated), Dean's Scholar honors, Monash exchange 2025

Certifications: Anthropic Claude 101, Anthropic AI Fluency, Azure AI-900. | **Languages:** English, Japanese, Nepali, Hindi.
